

Web Development?

Catalytic Dhairya (Cya)

Web Development kya hota hai?

- Websites banana aur maintain karna hi web development hai.
- Jaise Google, Amazon, Flipkart ki websites.

Complete Website kaise banti hai?

Frontend + Backend + Database = Full Website

Jaise:

User login karta hai → Backend check karta hai → Database se data aata hai → Frontend pe show hota hai.

Frontend kya hota hai?

- Jo user dekhta hai.
- Buttons, colors, text, images, layout.
- Languages:
 - HTML = structure
 - CSS = design/style
 - JavaScript = functionality
 - Example: Website ka face/front side.

Backend kya hota hai?

- Jo user ko nahi dikhta.
- Login system, data processing, server logic.
- Languages:
 - Python (Django/Flask)
 - JavaScript (Node.js)
 - Java (Spring Boot)
 - PHP (Laravel)

Example: Website ka brain.

Database kya hota hai?

- Data store karne ki jagah.
- Username, password, orders, comments.

Database Management Systems (DBMS) software/tools jo data store aur manage karte hain

- MySQL
- MongoDB

Example: Website ki memory.

EXAMPLE: Login ke time kya hota hai?

Tum website kholo aur login karo:

- Email dala
- Password dala
- Login button dabaya

Phir: **Step 1: Frontend**

Form data bhejta hai backend ko.

Step 2: Backend kya check karta hai?

Backend database se poochta hai:

Is email ka account hai kya?

Password sahi hai kya?

Step 3: Agar sab sahi hai → Login success

Galat hai → Invalid password

JavaScript frontend functionality kya hoti hai?

Frontend JavaScript **jo user screen par interact karta hai** usko control karti hai.

Example:

- Button click par menu open hona
- Form validation (“email galat hai”)
- Dark mode on/off
- Slider move hona
- Live search
- Calculator on page

Ye sab user ko dikhta hai.

Frontend JavaScript vs Backend difference

Frontend JavaScript Browser mein chalti hai.
User ke device par run hoti hai.

Visible effects deti hai

Example: Button click → color change

Backend Server par chalta hai.
User ko directly code nahi dikhta.

Heavy logic + security + database handle karta hai

Example:

- Login verify karna
- Data save karna
- Payment process
- OTP bhejna

✨“JavaScript frontend mein page ko zinda banati hai, backend mein website ko smart banata hai.”

QUESTION:

Kya sirf Frontend + Backend se complete website ban sakti hai?
